fieldValidation.js

project9 > middleware > fieldValidation.js > ...

```javascript
// Form Validation function - validates that required new-post form fields are present before completing request
const validateForm = (req, res, next) => {
    // Check to see if new post form title and body are present before submission
    if (!req.body.title || !req.body.body) {
        // Failure -> reload new post page -> kill the request
        return res.redirect('/new-post');
    }
    else {
        // If present -> move on
        next();
    }

}
// Image Validation function - validates that an image file is present before completing request
const validateImage = (req, res, next) => {
    // Check to see if an image file has been uploaded before submission
    if (!req.files || !req.files.image) {
        // Failure -> reload new post page -> kill the request
        return res.redirect('/new-post');
    }
    else {
        // If present -> move on
        next();
    }
}

// Export middleware functions
module.exports = { validateForm, validateImage };
```

newPost.js

project9 > controllers > newPost.js > ...

```javascript
// Import Post module for MongoDB operations
const Post = require('../models/Post');

// GET /new-post — render the new post creation form
exports.getNewPostForm = (req, res) => {
    res.render('new-post');
};

// POST /new-post — save a new post (no image) and redirect home
exports.createPost = async (req, res) => {
    const post = new Post({
        title: req.body.title,
        body: req.body.body
    });
    await post.save();
    res.redirect('/');
};
```

postRoutes.js

project9 > routes > postRoutes.js > ...

```javascript
// Express import
const express = require('express');

// Initialize Express router
const router = express.Router();

// Field Validation import
const { validateForm, validateImage } = require('../middleware/fieldValidation');

// Controller imports
const getPostController = require('../controllers/getPost');
const newPostController = require('../controllers/newPost');
const storePostController = require('../controllers/storePost');
const homeController = require('../controllers/home');
const aboutController = require('../controllers/about');
const contactController = require('../controllers/contact');

// Homepage – display all blog posts
router.get('/', homeController.getHomepage);

// New post form – display creation form
router.get('/new-post', newPostController.getNewPostForm);

// New post submit – save post without image & validate before request is finished
router.post('/new-post', validateForm, newPostController.createPost); // Will only run if validation passes

// Single post – display one blog post by ID
router.get('/post/:id', getPostController.getSinglePost);

// Store post with image – save post with uploaded image & validate before request is finished
router.post('/posts/store', validateForm, validateImage, storePostController.storePostWithImage); // Will only run if validation passes

// About page
router.get('/about', aboutController.getAbout);
```
